Relationship of IQ to suicide and homicide rate: An international study.

Suicide and Homicide Rate: An International Study

Donald I. Templer, Heather Joy Connelly

Alliant International University

David Lester

Richard Stockton State College

Hiroko Arikawa

Forest Institute of Professional Psychology

and Leah Mancuso

Alliant International University

IQ was correlated with Z-score of suicide rate minus Z-score of homicide rate using nine regions of the world. The correlations were .90 and .83 with crude rates and age adjusted rates respectively. It was suggested that more intelligent persons kill themselves because of more internal locus of control and that less intelligent persons kill others because of more external locus of control.
